

```
scores = cross_val_score(k2, X, y, cv=kf,  
                           scoring='mae')
```

```
print(scores)
```

```
print(scores.mean())
```

1. Machine learning nima?

- Machine learningga hayotiy misollar keltirish.

2. Machine learning turlari?

2. Machine learning turlari farqi va qanday ishlashi.

3. Evaluation nima?

3. Evaluationning classification va Regression da ishlashi.

4. Train va test nima?

4. Train va test qilish oqim jarayoni coding bo'yicha.

5. X - cross validation nima?
5. X - Fold cross validation ishlatilg?

Tabulate

Tabulate - bu Python kutubxonasida bo'lib ma'lumotlarni jadval (table) ko'rinishida chiqardi chiqarish uchun ishlatiladi.

Tabulate kutubxonasini konsolda yoki terminalda ma'lumotlarni jadvali va igitish asosida bo'lgan jadval ko'rinishida chiqarish uchun ishlatiladi. Python, Data Science va Machine Learning bo'yidagi natijalarni taqdim etishda juda foydali.

```
from tabulate import tabulate
```

```
results = [  
    ['Logistic Regression', 0.36, 0.94, 0.36],  
    ['Decision Tree', 0.41, 0.41, 0.27]  
]
```

```
headers = ['Algorithm', 'Precision', 'Recall',  
           'Accuracy score']
```

```
table = tabulate(results, headers =  
headers, tablefmt = 'grid')  
print(table)
```

Caption

Algorithm	Precision	Recall	Accuracy score
Logistic Reg.	0.36	0.94	0.36
Decision Tree	0.41	0.41	0.27
